The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridise to complementary RNA such as cellular mRNA or viral RNA, to hybridise to complementary RNA such as cellular mRNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (inbonuclease) H degradation of target RNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= a
/note= "Bases 9 and 10 are linked by a butanediol linker
which is represented as B in page 49 and X in page 60,
Fig 3 and 4 of the specification"
                                                                                                                                                                                                                                                                                                                                       Novel acyclic linker-containing oligonucleotide useful for preventing decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Acyclic linker; gene expression; gene therapy; ribonuclease; RNase H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequencespecific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                breast cancer; cytostatic; gene therapy; human; ss; primer; PCR; SNP; single nuclectide polymorphism; MAP kinase; MAPKIO; JMK3; JMK3A; p493F12; p54bSAPK MAP kinase; C-Jun kinase; d-Jun kinase; c-Jun kinase; c-Jun kinase; c-Jun kinase; c-Jun kinase; c-Jun kinase j; stress activated protein kinase beta;

                                                                                                                                                                                                                                                                ŏ
                                                                                                             The invention relates to a novel method for identifying a subject at risk
of polymorphic variations in the ICAM, MAPK10, KIAA0861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample
                                                                                                                         of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) of the invention which was used to genotype human MAP kinase MAPKIN (JNKS, JNKS, p493F12, p546SABK MAP Kinase, CJun kinase 3,JNK3 alpha protein kinase; Jun N-terminal kinase 3, stress activated protein kinase beta)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hairpin ribozyme; cholesterol ester transfer protein; mRNA cleavage;

CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoprotein; The mumbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme then binds to 4-6 nucleotides 5', and a variable number 3' of this site. The libozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or clearing ly lipoproteins (BUD), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically atherosclerosis, peripheral vascular disease, hyperbetalloporoteinsemia, dyslipidaemia, familial hypercholesterolaemia, hyperbetinoproteinemia, vascular complications of diabetes, transplant, atherectone and low density ceptenomis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and a corresponding increase in HDL levels). The Tibozymes can also be used diagnostically to study genetic drift and mataging matagines calls, and the CETP mRNA. As the ribozymes target specific regions of the CETP gene, they have low non-specific transfer protein (CETP) hairpin ribozymes (see AAT50547-T50594).

Detecting retroviral DNA using labelled oligo:nucleotide(s) - which bind to the primer binding site of a retroviral genome, useful as sequence

The human genome is thought to contain around 1300 transfer RNA (tRNA) genes and pseudogenes encoding 60-90 tRNAs. Of these, 20 have been sequenced and 11 tRNA sequences have been shown to act as primers for synthesising the (-)-strand of retroviruses by reverse transcriptase. The oligonucleotides AAT92001-24 are derived from the 3' ends of tRNA genes and are used to detect novel retroviruses or endogenous retroviral sequences found in the human genome, by binding to the conserved primer binding sites (PBS) found in retroviral genomes. This oligonucleotide is derived from the 18 nucleotides at the 3' end of the tRNA-His sequence. Endogenous retroviral sequences may serve as useful tags in animal evolutionary studies and breeding programmes and, potentially, in

This sequence is a PCR primer for a sequence tagged site (STS) present on the Y chromosome. This primer was used to isolate the DAZ gene of the the Y chromosome. This primer was used to isolate the DAZ gene of the Toronton, which is part of the DAZ family of genes, and was isolated to invention, which is part of the DAZ gene (A) is known to be associated with creduced sperm counts. Hence, the invention may be used to diagnostically identify males with a condition that results in a reduced sperm count.

CC such as oligospermia or azoospermia (i.e. where sperm count or to 20 cmillion semen per ml), in whom the gene (A) has been altered it may also be used therapeutically in gene therapy treatments to remedy fertility disorders associated with the alteration or deletion of (A).

CC Additionally, (A) may be useful in designing or identifying agents which may function as a male contraceptive by inducing reduced sperm count. It also has an application as a research tool, as the DNA has been localised to interval 6E of the distal portion of the long arm of the human Y chromosome, it can, therefore, function as a marker for that interval.

CC horomosome, it can, therefore, function as a marker for that interval.

CC inter is known about the causes of reduced spermatogenesis, especially among the 10% of men who visit fertility clinics and are diagnosed as the armong the 10% of men who visit fertility clinics and are diagnosed as diagnostic tests and treatments are currently available, improved methods are still needed. The invention provides new diagnostic methods and erreatments are unreathy available, and are still needed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treatments for oligospermia resulting from alteration or deletion of (A)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a family of human genes referred to as the DAZ gene family, and to a functional DAZ homologue, DAZH. Members of the DAZ gene family, and to a functional DAZ homologue, DAZH. Members of the DAZ gene family are clustered in the same region of the Y chromosome. In particular, the invention relates to an isolated DAZ gene (AAZ92499) present in interval 6D and/or 6E of the distal portion of Yq, mutations in which are associated with reduced sperm count. The DAZH gene (AAZ925890) is located on chromosome 3; however, the entire DAZ gene family, including DAZH is expressed in germ cells. DAZ and DAZH the diagnosis of cases of reduced sperm count associated with alteration or deletion of the DAZ gene. They are also used as human chromosome Y markers. Functional DAZ genes can be used in gene therapy for treating reduced sperm counts. Sequences AAZ9502-289513 represent PCR primers used in the exemplifications of the invention to test for Y-specific STSs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Allele specific primer A for human stenosis associated marker hCV7481596.
                                                                                                                                                                                                                                                                                                                                                       New nucleic acid, useful for diagnosis and treatment of reduced sperm count, is derived from the human DAZ or DAZH genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

for developing coronary stenosis comprising detecting a single nucleotide polymorphism (SNP) in any one of the 67073 nucleotide sequences (not given in the specification), in the individual's nucleic acide, where the presence of the SNP is correlated with an altered risk for stenosis in the individual. Also included are an isolated nucleic acid molecule (comprising at least 8 contiguous nucleotides where one of the solution of the individual. Also included are an isolated nucleic acid molecule (comprising at least 8 contiguous nucleotides where one of the containing an animo acid sequence selected from any of the 505 amino acid sequences (not defined in the specification), an antibody that specifically binds to the polymorleotide (or its antigen-binding complement), an amplified polymucleotide containing the SNP as cited (where the amplified polymucleotide containing the SNP as cited (where the amplified polymucleotide containing the SNP as cited (where the amplified polymucleotide is between about 1,000 mucleotides in length), an isolated polymucleotide which specifically hybridises to a nucleic acid molecule containing the SNP, a kit for detecting a SNP in a nucleic acid detecting a SNP in a nucleic acid detecting sNP in a nucleic acid molecule, detecting a variant polympeptide and identifying an agent useful complement, allele-specific primer extension, allele-specific primer extension, allele-specific primer extension, allele-specific primer extension, allele-specific primer of amplification, allele-specific primer of amplifying a SNP-containing region of a human marker contained with the specification of a human marker contained with the specification.

Specific primer for amplifying a SNP-containing region of a human marker specification but are provided on a CD-R named CLOOISIOCDR which was not specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to identifying an individual who has altered risk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying an individual who has altered risk for developing stenosis comprises detecting single nucleotide polymorphism (SNP), in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence represents RNA coupled to a photosensitive texaphyrin molecule, which was used in a new method for photocleavage of DNA. Targeted intracellular light-induced cleavage of a selected DNA comprises introducing into a photosensitive texaphyrin (PT) coupled to an oligonucleotide which is complementary to the selected DNA and exposing the cell to light to cleave the DNA. Modulating the activity of a selected DNA comprises contacting the DNA with a Pr coupled to an oligonucleotide which binds to the DNA and exposing the DNA-PT mixture to light to cleave the DNA. These methods can be used e.g. in cleavage of DNA in footprinting analysis, DNA sequencing, chromosome analyses, gene isolation, recombinant DNA manipulations, mapping of large genomes and chromosomes and for site-directed mutagenesis. They can also be used in anti-viral therapy and for the treatment of cancers, inflammatory
                                                                  Photosensitive; texaphyrin; DNA cleavage; light induced; photocleavage;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of photosensitive texaphyrin cpds. - for light-induced cleavage of polymers of deoxyribonucleic acid in analyses or therapy.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VECF). A patient (preferably human) having a filt growth factor (VECF). A patient fims-like tyrosine kinase 1 (filt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (filk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; single nucleotide polymorphism; SNP; genotyping; DNA analysis;
allele specific oligonucleotide; ASO; reduced complexity genome; RCG;
genomic classification; identification; DNA fingerprinting;
tumour characterisation; hybridisation; 8s.

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. ANA35944 to ANA35947 represent sequences used in the exemplification of the present invention. ANA35948 to Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming calls ex vivo and implanting treated calls, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are

                                   method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a Sallele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be us to perform linkage analysis AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention AAA35948 to

09-FEB-2001; 2001WO-US004273.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids (e.g. a ribozyme or a DNazyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule DNazyme) an Inozyme (an endolytic nucleic acid cleaving an RNA motif) properessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif), a G-cleaver (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2^+. The CD20-targetting nucleic acid is used to cleave RNA of CD20. The treatment may further comprise the use of one or more the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more thereaties. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (MCCC) immuno therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutafeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a zinzyme molecule of the invention

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGOD). The cregulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) print a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent carion that is preferably Mg^2+. CC therapies. In particular, the CD20 targetting nucleic acid with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, HPV (human immunodeficiency virus) associated NHL, lymphoma, leukaemia, HPV (human immunodeficiency virus) associated NHL, mantle-cell clymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, condition associated NHL, lymphoma, condition associated NHL, lymphoma, manuncetic acid may be contacted with a cell to reduce NGO activity of the presence of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NGO activity of the condition associated NGO activity of the condition associated NGO activity of the condition associated with the level of NGO cell and treat a patient having a condition associated with the level of therapies. In particular, the NGO-targetting nucleic acid may be contacted with a cell to reduce NGO activity of the condition associated with the level of therapies. In particular, when NGO-targetting nucleic acid may be contacted with the NGO-targetting nucleic acid may be contacted with NGO-targetting nucleic acid may be contacted with NGO-targetting nucleic acid may further comprise the use of one or more cordinary stroke). Alzhaimer's disease, dementia, multiple ac Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and states which respond to the modulation of NOGO expression. are Triple-helix forming polydeoxyribonucleotides, useful for treating intracellular adhesion molecule-1 related diseases, e.g. psoriasis, directed against transcribed or promoter regions of the ICAM-1 gene.

triple helix forming oligonaclectides, having at least 3 sequential purine and/or pyrimidine bases, capable of inhibiting transcription of ICAM-1. (A) has a sequence specific for the transcribed or promoter regions of the ICAM-1 (intracellular adhesion molecule) gene. The products of the invention have antipsoriatic, dermatological, antiasthmatic, antihilamatory, immunosuppressive and gastrointestinal activity. (A) are used for tractment or prevention of ICAM-1-associated diseases, specifically psoriasis, neurodermatitis, allergic asthma, crohn's disease, autoimmune diseases and transplant rejection. Compared with antiseanse oligonucleotides, (A) provide a longer-lasting effect transcription is not possible). (A) may be coupled to psoralen to provide light-regulatable, sequence-specific downregulation of genes; this should make photo-ultra-violet therapy more specific, with reduced side effects. This invention describes novel polydeoxyribonucleotides (A), for use as AAI68599-AAI68673 represent oligonucleotides used to illustrate the method of the invention

New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production.

Claim 7; Page 108; 220pp; English

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications consist of one more of these modification, an LNA modification, two or more phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abjotic stress tolerance, improved nutritional value (e.g. alterning amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. conferring amino acid over production), nerbicide resistance (e.g. glyphosate resistance, prophyric repactoring and sulphonylurea herbicide cesistance, modified oil production of waxy starch), altered floral corpusing increased starch or production of waxy starch), altered floral corpusing content of morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearch or reduced linolent acid).

The oligonucleotides are also useful for producing albino mutants for the lso useful for producing albino mutants for the processes. This sequence represents a genome altering oligonucleotide of the invention of photosynthetic

genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications consist of o-methyl modification, an INA modification, two or more phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The obligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. glyphosate resistance, imidazolinone and sulphonylurea herbicide resistance, prophyric herbicide resistance or triazine resistance), disease resistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome of a The invention relates to an oligonucleotide for targeted alteration Claim 7; Page 108; 220pp; English.

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.

WPI; 2002-676582/73.

Example 2; Page 81; 718pp; English

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stopp codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL chares an overall structure organisation with the Patched protein. The shares an overall structure strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important to regulating male germ cell development, and the HTPL gene was useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the such disorders include disorders of testis, or activity of human HTPL. Such disorders include disorders of testis, or activity of human Greated in usele or colon function. HTPL proteins and nucleic acids are clinically useful disapnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sacroma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, unclar degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-whise stains, Sturge Meber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for reating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting (I) is useful for reducing ERG activity in a cell, by contacting (I) with RM, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnostic coll to cation such as mg14 and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological, antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour and; ogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verrues vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a nucleic acid molecule (I) which down regulates expression of an Eta-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma. Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Ileukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies ander conditions suitable for the treatment Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or

treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour condinction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, necvascular glaucoma, myopic degeneration, arthritis, pasciasis, verruca vulgaris, angiofibroma of tubercus selerosis, port wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu

Novel polynucleotide which down regulates expression of Ets-related genuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMAZyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, movocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hammerhead, Inozyme, G-Leaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for rereating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least trace of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acid molecule that modulates replication of West Nile Virus

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatisis, mencephalitis, myocarditis, meningits, neurologic infection, hepatitis, nocarditis, meningits, neurologic infection, hepatitis, nocarditis, meningits, nocardical infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molecy. Nucleic acid molecules SEQ ID NO 194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠ
                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatists, invection e.g. pancreatists, invection e.g. pancreatists, invection e.g. pancreatists, invection in the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMASyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclecides and a 3' and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HBR2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule activity. The nucleic acid molecules are useful for reducing HBR2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HBR2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, also useful for treating breast, ovarian, colorectal, lung, prostate, shown in ABZ5989 - ABZ66216, ABZ665131, ABZ66531, ABZ66520 - ABZ66524, ABZ66531, ABZ66531
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammeribad ribozyme; DNAzyme; inozyme; tenzymetic nucleic acid; hammeribad ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; virucide; hepatocellular carcinoma; hepatoctropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such amemerhead ribozymes. DNAzymes, inozymes, zinzymes, anberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule, Hepatitis C virus, HCV, Hepatitis B virus, HBV, RNA stability, RNA expression, RNA synthesis; antisense;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, include antisense and enzymatic nucleic acids such as hammerhead ribozymes. Also disclosed are nucleic acid decoy molecules and G-cleaver ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well ranscriptase and/or HBV reverse transcriptase primer sequences, as well so oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV canson and/or potential therapies disclosed is a method for screening compounds and/or potential therapies disclosed is a method for screening compounds of the invention are useful for the treatment of degenerative and section as expression and section and gene apprehenced to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepprocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
amberzyme, G-cleaver ribozyme, decoy molecule, aptamer,
HBV reverse transcriptaee; Bhhancer I region, viral replication,
degenerative, disease state; HBV infection; HCV infection; cirrhosis;
liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;
virucide, antiinflammatory; substrate; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in virto as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                          Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ss.
                                                                                                                                                   Murine oligonucleotide associated with tumour supression, SEQ ID 100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying audifying and/or amplifying nucleic acids, as an in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant models. The nucleotides (also vectors containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and or prognosis of these diseases. The nucleotides and polypeptides can containing the ucleotides and polypeptides can disease. The invention relates to a novel isolated nucleic acid that encodes a protein with a chromatin organisation modifier (CHROMO) domain. The polynucleotide of the invention demonstrates cytostatic activity-and may be useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as during gene therapy and vaccine production procedures. The current sequence is that of the human PCCP1-related DNA fragment SEQ ID 8-directed probe of the invention. Note: The current sequence is not shown within the specification per se but was retrieved from the WipoWeb
                                                                                                                                                                                                                                                                                                         database.

in the phenomena of tumour suppression, tumour reversion, apportosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention. This invention relates to novel isolated nucleic acid sequences involved

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for determining the animal species that is the origin of a sample. The method is very general, quick and easy to do. It can detect material from a species even when present in small amounts in presence of materials from several other species the species being tested do not have to be known a priori. DNA was isolated from an animal sample and amplified by PCR using two primers. The amplicon, containing a promoter for RNA TY polymerase (present in one of the primers) was transcribed with incorporation of a fluorescent ribonucleotide, then transcripts cleaved to fragments of 20 nucleotides. These were tested for hybridisation to a DNA chip carrying 17-mer capture probes, specific for different animal species. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   set of

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PrGDR),
IkappaB kinase (ITK), or protein kinase PRR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CMS) injury, spinal cord injury, cancer (e.g. melanoma,
Iyaphoma or glioma), inflammatory disease, cl.g. rheumatoid arthritis,
restenosis or asthma), Crohm's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human NOGO
receptor zinzyme substrate sequence.
                                                                                                                                                                                                                                                                      Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection;

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (FTGDR),
IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
cerebrous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid architis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cerebrous and mutations within diseased cells or to detect the presence of
the invention and as a diagnostic tool to examine genetic
chifts and mutations within diseased cells or to detect the presence of
the invention are also useful for deventations and allergic
chifts and mutations within diseased cells or to detect the presence of
the control of the invention are also useful for deventations deniced and as a diagnostic tool to examine genetic
therefore the present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antisense oligonucleotide; neurite growth inhibitor; NOGO, prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protain kinase PKR; cerebrovascular accident, central historia system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; authoriam cord injus; multiple solerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           15-JAN-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence.
The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
IKappaB kinase (IKK), or protein kinase PKR. The mucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (IKS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cypression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of
target RNA in a cell. The present RNA sequence represents a human PKR

The invention describes a method of modifying (M1) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and contacting the cell with a DNA modifying molecule (I) that modifies the nucleotide sequence. (M1) is useful for modifying a nucleotide sequence in the genome of a cell such as a human cell or is a pertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. A second method is described (M2) useful for mutating a nucleotide sequence in the genome of a cell, where the mutating a step comprises introducing a debetion, insertion, substitution, strand break, adduct formation, gene conversion or recombination of a novel sequence. The cell is a fertilised egg cell from an animal chosen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= j

from mouse, hamster, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell chosen from blastomere cell, eight-cell embryo cell, blastocoel cell, mid gestation cell, embryo cell, or an embryonic stem cell. A modified oligonucleotide is useful for treating a medical condition, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide to produce a modified cell.

The person may be suffering from a genetic disease such as severe combined immunodeficiency associated with adenosine deaminase deficiency, familial hypercholesterolemia, Gaucher disease and Lesch-Nyhan syndrome. (M2) is useful for determining the effect of mutation on the cell, or for treating a medical condition. (M2) is also useful for generating transgenic cells or transgenic cells or transgenic animals that are useful as models of diseases and for screening therapeutic reagents and for targeted recombination for the purpose of producing gene knock-out organisms and/or of replacement of defective genes with non-defective genes. The method is also useful for determining the function of a gene of unknown function. The method is efficient in enhancing mutation and/or recombination rates in cell lines, tissues, and organisms. The method is allows targeting a mutation to an intracellular gene sequence at an increased efficiency. This sequence represents a triplex hells forming colligonucleotide that can be used to introduce mutations into a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 17 BP; 0 A; 4 C; 0 G; 13 T; 0 U; 0 Other;

Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide 

Example; SEQ ID NO 4; 59pp; English.

The invention describes a method of modifying (MI) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and contacting the cell with a DNA modifying molecule (I) that modifies the nucleotide sequence (MI) is useful for modifying an expensive the nucleotide sequence of a cell such as a human cell or is a certificate egg cell from an animal chosen from mouse, hammer, sheep, pig, rabbit, and cow, A second method is described (M2) useful for mutating a nucleotide sequence in the genome of a cell, where the mutating a nucleotide sequence in the genome of a cell, where the comprises introducing a deletion, insertion, substitution, strand break, adduct formation, generation, substitution, a cream substitution, a conse, hamster, ableap, pig, rabbit, and cow. Preferably, the cell is a nouse cell chosen from blattomer cell, embryo cell, or an embryonic stem a mouse, hamster, ableap, pig, rabbit, and cow. Preferably, human is contacting with a modified oligonucleotide is useful for treating a medical condition, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide to produce a modified cell. Combined immunodeficiency associated with adenosine deaminase deficiency familial hypercholesterolemia, Gaucher disease and Lesch-Nyhan syndrome. (M2) is useful for determining the effect of mutation on the cell, or treating a medical condition. (M2) is also useful as models of transgenic cells or transgenic and for targeted

The invention describes a method of modifying (M1) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and contacting the cell with a DNA modifying molecule (1) that modifies the nucleotide sequence. (M1) is useful for modifying a conclectide sequence in the genome of a cell such as a human cell or is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. A second method is described (M2) useful for mutating a nucleotide sequence in the genome of a cell, where the mutating step comprises introducing a deletion, insertion, substitution, conversion or recombination of a conversion break, adduct formation, gene conversion or recombination of a conversion to the cell is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell chosen from bistomece cell, eight-cell embryo cell, chastocoel cell, mid gestation cell, embryo cell, or an embryonic stem cell. A modified oligonucleotide is useful for treating a medical contacting with a modified oligonucleotide to produce a modified cell.

The person may be suffering from a genetic disease such as severe combined immunodeficiency associated with adenosine deminate definition, where the living cell of an animal (preferably, human) is familial hypercholesterolemia, Gaucher disease and Lesch-Nyhan syndrome.

(M2) is useful for determining the effect of mutation on the cell, or for treating a medical condition. (M2) is also useful for generating transgenic cells or transgenic animals that are useful as models of diseases and for transgenic animals that are useful as models of recombination for the purpose of producing gene knock-out organisms and/or of replacement of defective genes with non-defective genes. The method is also useful for determining the function of a gene of unknown function. The method is efficient in enhancing mutation and/or recombination rates in cell lines, tissues, and organisms. The method allows targeting a mutation to an intracellular gene sequence at an increased efficiency. This sequence represents a triplex helix forming oligonucleotide that can be used to introduce mutations into a cell Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide 'note= "OTHER= 2'-aminoethoxy thymidine" note= "OTHER= 2'-aminoethoxy thymidine" /mod\_base= OTHER /note== "OTHER= 2'-aminoethoxy cytidine" /mod\_base= OTHER /note= "OTHER= 5-methyl uridine" (USSH ) US DEPT HEALTH & HUMAN SERVICES. The invention describes a method of modifying (MI) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and contacting the cell with a DNA modifying molecule (I) that modifies the nucleotide sequence (MI) is useful for modifying a nucleotide sequence in the genome of a cell such as a human cell or is a ceffertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. A second method is described (M2) useful for mutating at nucleotide sequence in the genome of a cell, where the comprises introducing a deletion, insertion, substitution, strand break, adduct formation, gene conversion or recombination of a novel sequence. The cell is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell chosen from blastomere cell, embryo cell, or an embryonic stem condition, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide to produce a modified cell. The person may be suffering from a genetic disease such as severe combined immunodeficiency associated with adenosine deaminase deficiency. Familial hypercholesterolemia, Gaucher disease auch as severe combined immunodeficiency associated with adenosine deaminase deficiency. Treating a medical condition. (M2) is useful for generating the effect of mutation on the cell, or transgenic cells or transgenic animals that are useful as models of diseases and for screening there are useful as models of diseases and for screening there are useful as models of diseases and for screening there are also useful as models of diseases and for screening there are also useful as models of diseases and for targeter and province the animals but are useful as models or diseases and for the area of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   recombination for the purpose of producing gene knock-out organisms and/or of replacement of defective genes with non-defective genes. The method is also useful for determining the function of a gene of unknown function. The method is efficient in enhancing mutation and/or recombination rates in cell lines, tissues, and organisms. The method allows targeting a mutation to an intracellular gene sequence at an increased efficiency. This sequence represents a triplex helix forming
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oligonucleotide that can be used to introduce mutations into a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention describes a method of modifying (M1) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and contacting the cell with a DNA modifying molecule (I) that modifies the nucleotide sequence. (M1) is useful for modifying a certilised egg cell from an animal chosen from mouse, hamser, sheep, cpiq, rabbit, and cow. A second method is described (M2) useful for mutating a nucleotide sequence in the genome of a cell, where the mutating at properties introducing a deletion, insertion, useful for mutating a properties introducing a deletion, insertion, of a mutating a nucleotide sequence in the genome of a cell, where the mutating etp comprises introducing a deletion, insertion of a novel sequence. The cell is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell, chosen from blastomere cell, edght-cell embryo cell.

CC condition, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide is useful for treating a medical condition of a genetic disease such as severe combined immunodeficiency associated with adenosine deaminase deficiency.

(M2) is useful for determining from a genetic disease and lassevere (CC femilial hypercholesterolemia, Gaucher disease and Lesch Nyhan syndrome.

(M2) is useful for determining the effect of mutation on the cell, or for treating a medical condition. (M2) is also useful for generating crecombination for the purpose of producing gene knock-out organisms and/or of replacement of defective genes with non-defective genes. The method is also useful for determining the function of a gene of unknown then chod is efficient in enhancing mutation and/or recombination rates in cell lines, tissues, and organisms. The method is clincased efficiency. This sequence represents a triplex hardon coll contacting the intracellular gene equence at an engagenic cells chart can be used to introduce mutations to intracen Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide Gарв ; 0.7%; Score 13.8; DB 1; Length 17; 88.2%; Pred. The invention describes a method of modifying (M1) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and concacting the cell with a DNA modifying molecule of the cell cycle, and concacting the cell with a DNA modifying molecule of the cell cycle, hamfer, sheep, and concacting the cell such as a human cell or is a fertilised egg cell from an animal chosen from mouse, hamfer, sheep, pig, rabbit, and cow. A second method is described (M2) useful for mutating a nucleotide sequence in the genome of a cell, where the mutating sep comprises introducing a deletion, insertion, or servand break, adduct formation, gene conversion or recombination of a novel sequence. The cell is a fertilised egg cell from an animal chosen from mouse, hamfer, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell chosen from blastomere cell, embryo cell, or an embryonic stem of from mouse, hamfer, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell chosen from blastomere cell, embryo cell, or an embryonic stem of condition, where the living cell embryo cell, or an embryonic stem condition, where the living cell of an animal (preferably, human) is condition, where the living cell of an animal (preferably, human) is condition with a modified oligonucleotide to produce a modified cell.

The person may be suffering from a genetic disease such as severe combined immunodeficiency associated with adenosine deaminase deficiency, familial hypercholesterolemia, Gaucher disease and Lesch.Whan syndrome. (M2) is useful for determining the effect of mutation on the cell, or for transgenic cells or transgenic animals that are useful as modical condition. (M2) is also useful for generating the function of a gene of unknown method is also useful for determining the function of a gene of unknown cell moreased efficiency. The method is also useful ines equence represents at the compination real and the can be useful in the sequence of uncreased efficiency. The sequence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell therapy; modified oligonucleotide; S-phase; cell cycle; deletion; insertion; substitution; strand break; adduct formation; gene conversion; blastomere cell; eight-cell embryo cell; blastocoel cell; mid gestation cell; embryo cell; embryonic stem cell; severe combined immunodeficiency; adenosine deaminase deficiency; transgenic; gene knock-out; thermal degradation study; ss; triple helix forming oligonucleotide.
                                            Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

cc mucleotide sequence in the genome of a cell such as a human cell or is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, cc mutating a nucleotide sequence in the genome of a cell, where the comparison and cow. As second method is described (M2) useful for mutating a nucleotide sequence in the genome of a cell, where the comparison or recombination of a conversion break, adduct formation, gene conversion or recombination of a conversion hamster, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell chosen from blastcomere cell, eight-cell embryo cell, cell, condition, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide is useful for treating a medical condition, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide to produce a modified cell.

The person may be suffering from a genetic disease such as severe contacting with a modified oligonucleotide to produce a modified cell.

The person may be suffering from a genetic disease and tesch-Nyhan syndrome.

CC familial hypercholesterolemia, Gaucher disease and Lesch-Nyhan syndrome.

CC familial hypercholesterolemia, Gaucher disease and Lesch-Nyhan sprdrome.

CC fransgenic cells or transgenic animals that are useful for generating crecombination for the purpose of producing gene knock-out organisms

CC recombination for the purpose of producing gene knock-out organisms

CC diseases and for screening therapeutic reagents and for replacement of defective genes with non-defective genes of unknown function. The method is efficient in enhancing mutation and/or crecombination rates in cell lines, tissues, and organisms. The method is also useful for an intracellular gene sequence at an increased efficiency. This sequence represents a triplex then the converse of producing entations into a cell intrace of intraces or intraces or intraces or int
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

```
The invention describes a method of modifying (MI) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and contacting the cell with a DNA modifying molecule (I) that modifies the nucleotide sequence. (MI) is useful for modifying a nucleotide sequence in the genome of a cell such as a human cell or is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, gig, rabbit, and cow. A second method is described (MI) useful for mutating step comprises introducing a deletion, insertion, substitution, antating step comprises introducing a deletion, insertion, substitution, strand break, adduct formation, gene conversion or recombination of a strand break, adduct formation, gene conversion or recombination of a strand break, hamster, sheep, pig, rabbit, and cow. Preferably, the cell is mouse cell chosen from blastomere cell, eight-cell embryo cell, a mouse cell coll, mid gestation cell, embryo cell, or an embryonic stem cell. A modified oligonucleotide is useful for treating a medical confitton, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide to produce a modified cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide

The person may be suffering from a genetic disease such as severe combined immunodeficiency associated with adenosine deaminase deficiency, familial hyperchosterolemia, Gaucher disease and Lesch-Nyhan syndrome. (M2) is useful for determining the effect of mutation on the cell, or for treating a medical condition. (M2) is also useful for generating transgenic cells or transgenic animals that are useful as models of diseases and for screening therapeutic reagents and for targeted recombination for the purpose of producing gene knock-out organisms and/or of replacement of defective genes with non-defective genes. The method is also useful for determining the function of a gene of unknown function. The method is efficient in enhancing mutation and/or recombination rates in cell lines, tissues, and organisms. The method and allows targeting a mutation to an intracellular gene sequence at an allows targeting a mutation to an intracellular gene sequence at an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell therapy; modified oligonucleotide; S-phase; cell cycle; deletion; insertion; substitution; strand break; adduct formation; gene conversion; blastomere cell; eight-cell embryo cell; blastocoel cell; mid gestation cell; embryo cell; embryonic stem cell; severe combined immunodeficiency; adenosine deaminase deficiency; adenosine deaminase thypercholesterolaemia; Gaucher disease; Lesch-Nyhan syndrome; transgenic; gene knock-out; thermal degradation study; ss; triple helix forming oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                         increased efficiency. This sequence represents a triplex helix forming oligonuclectide that can be used to introduce mutations into a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a method of modifying (MI) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell cycle, and contacting the cell with a DNA modifying molecule (CI) that modifies the nucleotide sequence. (MI) is useful for modifying an oucleotide sequence in the genome of a cell such as a human cell or is a certain sequence in the genome of a cell such as a human cell or is a certain and cow. A second method is described (M2) useful for mutating step comprises introducing a deletion, insertion, substitution, gentrand break, adduct formation, gene conversion or recombination of a novel sequence. The cell is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. Preferably, the cell is a mouse cell chosen from blastomere cell, eight-cell embryo cell, a mouse cell chosen from blastomere cell, eight-cell embryo cell, condition, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide to produce a modified cell. The person may be suffering from a genetic disease such as severe combination may be suffering from a genetic disease such as severe combination dedical condition, (M2) is useful for determining the effect of mutation on the cell, or for treating a medical condition, (M2) is also useful as models of diseases and for screening therapeutic reagents and for transgenic animals that are useful as models of diseases and for screening therapeutic reagents and for transgenet of defective genes with non-defective genes. The method is also useful for determining the function of a gene of unknown combination for the purpose of producing genes function and prove the purpose of producing genes with non-defective genes. The method is afficient in enhancing medical confidence in enhancing medical confidence in enhancing and for screening in the purpose of producing genes and for screening the feature genes and for screening the feature genes and for screening the feature genes with 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modifying nucleotide sequence in genome of a cell e.g. human cell or a fertilized egg cell of mouse, pig, or cow, by contacting cell in S-phase of the cell cycle with a DNA modifying molecule that modifies nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     recombination rates in cell lines, tissues, and organisms. The method allows targeting a mutation to an intracellular gene sequence at an increased efficiency. This sequence represents a triplex helix forming oligonucleotide that can be used to introduce mutations into a cell

This invention relates to a novel method of identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method may be useful for the production of plants with herbicide resistance, male or female sterile plants, abiotic stress tolerance, albino plants or plants with an altered anino acid production as well as for use in mammalian cell lines.
                                                                                                                                                                                                                                                                  Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mutant cell identification-related mutagenic oligonucleotide SeqID1099
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of a mutagenic oligonucleotide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cell identification; oligonucleotide-directed sequence alteration; selectable phenotype; transgenic plant; herbicide resistance; sterile plant; abiotic stress tolerance; albino plant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ensymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mutant cell identification-related mutagenic oligonucleotide SeqID1100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method of identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first uncleic acid target site within the cell. The method may be useful for the production of plants with herbicide resistance, male or female sterile plants, abiotic stress tolerance, albino plants or plants with altered amino acid production as well as for use in mammalian cell lines. The present sequence is that of a mutagenic oligonucleotide which was used in the exemplification of the invention.
                                                                                                                                                                            Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a

The invention describes a method of modifying (MI) a nucleotide sequence in the genome of a cell. The method comprises providing a cell in S-phase of the cell orgic, and contacting the cell with a DNA modifying molecule (I) that modifies the nucleotide sequence. (MI) is useful for modifying a nucleotide sequence in the genome of a cell such as a human cell or is a fertilised egg cell from an animal chosen from mouse, hamster, sheep, pig, rabbit, and cow. A second method is described (M2) useful for mutating a nucleotide sequence in the genome of a cell, where the mutating step comprises introducing a deletion, insertion, substitution, conversion or recombination of a conversion break, adduct formation, gene conversion or recombination of a conversion than step comprises introducing a deletion, insertion, substitution, a mouse cell chosen from brackers is seen in a from blastcomere cell, embryo cell, or a mouse cell chosen from brackers or cell, embryo cell, or an embryonic stem cell. A modified oligonucleotide is useful for treating a medical cell. A modified oligonucleotide to produce a modified cell.

The person may be suffering from a genetic disease such as severe conduction, where the living cell of an animal (preferably, human) is contacting with a modified oligonucleotide to produce a modified cell.

The person may be suffering from a genetic disease such as severe combined immunodeficiency associated with adenosine deaminase deficiency. Familial hypercholesterolemia, Gaucher disease and Lesch-Nyhan syndrome. (M2) is useful for determining the effect of mutation on the cell, or for treating a medical condition. (M2) is also useful for generating

Also included are an isolated nucleic acid molecule comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP as cited above, or their complement), an isolated polypoptide comprising an amino acid sequence selected from any of the 696 amino acid sequences (not defined in the specification), an antibody that specifically binds to the polypoptide (or its antigen-binding fragment), an amplified polymucleotide containing the SNP as cited (where the amplified polymucleotide containing the SNP as cited (where the amplified polymucleotide containing the snb acited (where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Allele specific primer A for human stenosis associated marker hCV7481596.
transgenic cells or transgenic animals that are useful as models of diseases and for the purpose of producing gene knock-out organisms and/or of replacement of defective genes with non-defective genes. The method is also useful for determining the function of a gene of unknown function. The method is efficient in enhancing mutation and/or allows targeting a mutation to an intracellular gene sequence at an increased efficiency. This sequence represents a triplex helix forming oligonucleotide that can be used to introduce mutations into a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to identifying an individual who has altered risk

```
cc nucleotides in length), an isolated polynucleotide which specifically hybridises to a nucleic acid molecule containing the SNP, a kit for detecting a SNP in a nucleic acid, detecting a SNP in a nucleic acid.

Cc detecting a SNP in a nucleic acid, detecting a SNP in a nucleic acid molecule, detecting a snapper an agent useful complete, detecting a variant polypeptide and identifying an agent useful in therapeutically or prophylactically treating stenosis. The detection set of the method is carried out by a process selected from allele-specific probe hybridisation, allele-specific primer extension, allele-specific primer extension, molecular specific amplification, sequencing, 5' nuclease digestion, molecular cranded conformation polymorphism. The method is useful for identifying an individual who has altered risk for developing coronary stenosis, which can lead to angina (ischaemic chest pain), myocardial infarction and ultimately sudden cardiac death. The present sequence is an allele specific primer for amplifying a SNP-containing region of a human marker specification but are provided on a CD-R named CL001510CDR which was not supplied with the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                  The sequences given in AAQ51816-24 represent areas of the multiple drug resistance (mdr-1) mRNA which are accessible to the ribozyme of the invention. The mdr-1 gene encodes a 170 kD integral membrane protein which confers resistance to certain chemotherapeutic agents, such as colchicine, doxorubicin, actinomycin D and vinblastine. The gene is cormally expressed in cells of MRNI transcript have been found in adenocarcinomas that are intrinsically resistant to a broad range of chemotherapeutic agents, such as those derived from adrenal, kidney, liver and bowel. The ribozymes of the invention may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of a gene that contributes to, or inhibits the expression of chronic myelogenous leukemia (CML), promyelocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma, lung cancer, other neoplastic and transformed cells elicits inhibition of the transformed state. mdr-1 specific ribozymes remove the mechanism of drug resistance used by transformed cells and thus enhances drug therapies for tumours. The ribozymes may also be used to study genetic drift and mutations within cells. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated peptide(s) of Lol or p I, major protein allergen of species Lolium perenne. - useful for diagnosis and treatment of sensitivity to rye-grass pollen allergen.
  enzymatic RNA molecules (ribozymes) - which cleave mRNA associated

AAQ73611 and AAQ73602 are a pair of primers used in the PCR generation and isolation of AAQ73597, which encodes Dac gI (AAR60704) a major protein allergen of Dactylis glomerata. Internal peptides (AAR60710-R6075) isolated from a ryegrass major protein antigen (AAR60703) can be used in the treatment and diagnosis of sensitivity to ryegrass pollen protein (Lol pl), or pollen proteins that are immunologically related to Diol pi e.g. Dac gI, Phl pi and Poa pi. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of a primer used to isolate the herpes simplex virus type 2 gene UL26, encoding the HSV-2 protease. The gene can be used in the diagnosis and treatment of HSV-2 infections. See also AAQ84671-8. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New herpes simplex virus (HSV)-2 protease and capsid protein - used to develop prods. for use in the diagnosis and treatment of {\rm HSV}{-2}

The present sequence represents a PCR primer from the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein of hTRT, by detecting the change in hTRT recombinant protein of presentation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase RNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant protein preparation of hTRT with a telomerase RNA component; (C) detection, amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT expression; and (E) the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits agent, A protein preparation of hTRT and the polymiclectide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity and be used to the agent or cancer. Inhibitors of telomerase activity and the telomerase activity. A complex of the manufacture of telomerase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of oppoliferation conditions especially cancer and ageing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 40; 387pp; English

                                                                                                                                                                                                                                        AAV49716-V49737 are oligonucleotide primers used in a method to construct novel fusion polypeptides which when expressed in a filamentous funginesult in the expression of fusion polypeptides. The fusion polypeptides are composed of a fist nucleic acid sequence which encodes a signal polypeptide functional as a secretory sequence in a first filamentous fungi. A second nucleic acid encodes a secreted polypeptide of functional portion thereof which is normally secreted from the same filamentous fungi or a second filamentous fungi. A third nucleic acid encodes a cleavable linker while a fourth comprises at least two nucleic acids encoding desired polypeptides. Such constructs can be used to produce encoding desired polypeptides. Such constructs can be used to produce proteins e.g. the anti-coagulants hirudin and its analogues. Such constructs provide higher levels of expression and secretion than known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Non-immunogenic, epitope, T-cell, immunogenicity, immune system; SK; immunoglobulin; therapeutic, streptokinase, de-immunised, 708, primer;

                                                                                                                                                                                                                                                 The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune or system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. Sequences AAV81047-68 represent oligonucleotides used for the construction of de-immunised 708
Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of

Novel biallelic markers used to construct a high density disequilibrium of the human genome map

Claim 8; Page 1984; 2745pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their

primers for the biallelic markers. The biallelic markers of the invention barners for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents acting on a disease as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. Novel delta endotoxin polypeptide of bacillus thuringiensis useful for controlling lepidopteran or coleopteran insect population comprises at least ten contiguous amino acids of a specific sequence.

Example 9; Page 117; 177pp; English.

The present sequence is a PCR primer designated AM43 which is based on the sequence of the Bacillus thuringiensis gene cryBT70 (AAAA6967), which encodes a delta-endotoxin crystal protein (AAY94299). The primer was used to identify wild-type strains of Bacillus thuringiensis that have sequences related to cryBT70. CryBT70 is an insecticide that releases toxins when solubilised by insect mid-gut proteolytic enzymes. It can be used to control and kill lepidopteran insects, such as Putella xylostella and Trichoplusia ni, or coleopteran insects, such as Western corn rootworm and Colorado potato betle. The composition comprising CryBT70 is eco-friendly as it is toxic to specific target insects but harmless to plants and other non-targeted organisms. The cryBT70 gene may

ô be expressed in Bacillus thuringiensis cells to produce an insecticide in relate form of powder, pellet, spray etc or may be used to generate insectrasistant transgenic plants. Parts of the sequence may also be used as hybridisation probes to detect nucleic acids encoding delta-endotoxins. A probe (AAA2696) specific for the N-terminal amino acid sequence of the protein was designed using codons typically found in B. thuringiensis toxin genes and was used to screen a genomic library composed of DNA sequences from B. thuringiensis strain EG4140. DNA from hybridised colonies was extracted and sequenced The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to Oligonucleotide array; genotyping; single base extension reaction; SBE; PCR primer; polymorphic locus; single nucleotide polymorphism; ss. Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length targeted to a nucleic acid encoding human Akt-3. The antisense compounds are useful for inhibiting the expression of human Akt-3 in human cells or tissues. They are also useful for modulating the expression of Akt-3, and for treating a human or an animal suspected of having, or being prone to, a disease or condition associated with Akt-3 expression. The antisense compounds may also be used as research reagents, in kits and in diagnostics, e.g. to elucidate the function of a particular gene or to distinguish between functions of various members of a biological pathway; and as a prophylactic, e.g. to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compounds targeting nucleic acids encoding human Akt-3 useful for treating a disease or condition associated with Akt-3 expression, or in preventing or delaying inflammation or tumor formation.
                                                                                                                                                                                                                                                                          Human; Akt-3; protein kinase; cytostatic; antiinflammatory; infection;

The invention discloses a method of determining a functional single nucleotide polymorphism (SNP) in a gene. The method comprises conclecting a candidate gene, providing a random sample population, isolating from each individual, at least one fragment of nucleotide sequence of the candidate gene, identifying at least one SNP in one of the isolated fragments and, from the SNP(s) identified, identifying those with functional SNP in a gene and for genetic diagnosis of a disease, or a resistance to a disease, linked to the presence of a mutated nucleotide sequence of the preselected candidate gene in an individual. The method is also useful for genetic markers, for preparing a solymucleotide or polypeptide comprising the SNP which is useful for the presence or a metaced nucleotide sequence of a medicament for treating an individual having a pathology and/or disease correlated to the presence or absence of a mutated allele, functional SNPs enables the identification of new therapeutic targets and the creating and attive molecules such as antibodies, vectors of the cuttangy and active molecules determined from the structure of the mutated proteins encoded by the mutated alleles of the SNP containing genes. The method saves time, money and energy in the discovery of potential targets and is more reliable for discovering the prognestic/disapnostic and therapeutic targets on the genome in comparison to studies of associations or resistant to the disease based on genotyping studies sensitive or resistant to the disease based on genotyping the studies sensitive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence presented is the antisense PCR primer, #10, which was used to identify the RLGG and Q27E beta-2-adrenesylor receptor (ABRB2) SNPB to validate the disclosed method of SNP identification. These ADRB2 SNPs are associated with nocturnal asthma and obesity, respectively
                                                                                                                                                                                                      Determining single nucleotide polymorphisms in nucleotide sequence of preselected gene, comprises isolating fragment of preselected gene from each individual of random population and identifying single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; colon cancer; oestrogen receptor; myoglobin; p21; p27; p16; p53; progesterone receptor; pona; CBA; odc2; c-erbB2; methylation; CpG; characterisation; classification; diagnosis; differentiation; colon cell proliferative disorder; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel genes encoding Coleopteran inhibitory Bacillus thuringiensis insecticidal crystal proteins, tIC851, cryE770 and cry22Aa. These proteins are insecticidally active and provide plant protection from coleopteran insects such as cotton boll weevil (Anthonowus grandis Bohemian). Compositions containing proteins of the invention are useful for making transgenic plants resistant to coleopteran insect infestation. The present DNA sequence is a PCR primer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pora, cdc2, c-ers2, p53 and/or CEA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG positions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) of a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and pretreated genomic DNA is useful for the determination of SNPs. The methods and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon call processing the part of the colon colon colon colonnel in the contact of the methylation status of the colonnel colonne
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                              Determining methylation status of CpG dinucleotides using modified genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the characterization, grading, staging and/or diagnosis of colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; colon cancer; oestrogen receptor; myoglobin; p21; p27; p16; p53; progesterone receptor; pcna; CBA; dcc2; c-erbB2; methylation; CpG; characterisation; classification; diagnosis; differentiation; colon cell proliferative disorder; PCR primer; ss.

The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pona, oddc2, o-ers12, p53 and/or CEA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG contions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) concresponding genomic DNA by analysis of a chemically pretereated genomic DNA. The pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and/or detection of the methylation, classification, diagnosis and differentiation of colon cell proliferative disorders. ACF62752 to ACF63278 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                              Determining methylation status of CpG dinucleotides using modified genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the characterization, grading, staging and/or diagnosis of colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; mouse; skin structure; skin; laminin 5 chain gene; LAMA3; LAMB3;

ö The present invention describes a method and a kit for determining the expression of mRNA or CDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes LAMMA, LAMB3 and LAMC2, matrix metalloproteinases MMP-1, MMP-2, MMP-3 and MMP-9, VII collagen, type I collagen alpha 1 chain, type I collagen alpha 2 chain, type IV collagen alpha 2 chain, TIMP-1, TIMP-2 and TIMP-3. ABV75973, RESULT

The present sequence is one of a primer pair (see also ABV75974) used in the RT-PCR amplification of insulin cDNA in a semi-quantitative analysis of expression levels of pancreas-specific genes in mouse embryonic stem (ES) cells. In this example of the invention, mouse ES cells were electroporated with murine Pdx1 (see ABV75967) or Pax4 (see ABV7596) genes. The ES cells were then cultivated as embryoid bodies, and differentiated into insulin-producing cells. RT-PCR analysis showed that insulin mRNA levels were higher in Pdx1+ and Pax4+ ES cells than in wild-type ES cells indicating that differentiation is more efficient when a parcreatic developmental control gene is activated. The invention provides a method of differentiating stem cells into insulin-producing cells by activation of a gene involved in beta-cell differentiation, e.g. Pax4 or Pdx1. The insulin-producing cells are useful for the treatment of paragraph of differentiation and matabolic and matabolic with Differentiating stem cells into insulin-producing cells useful for treating pancreatic diseases, by culturing stem cells in suitable medium and activating gene involved in beta-cell differentiation. pancreatic diseases, metabolic syndrome and metabolic disorders with impaired glucose levels such as diabetes, hyperglycaemia and impaired 0.7%; Score 13.8; DB 1; Length 18; 88.2%; Pred. New nucleic acid sequences from Hepatitis C virus (HCV) genome corresponding to HCV1a, HCV2a, HCV3a, HCV3b and HCV4a subtypes, useful as vaccine for the preventing and/or treating HCV infection.

WPI; 2003-767436/72.

Holland-Staley C;

Claim 1; SEQ ID NO 31; 101pp; English.

The invention relates to nucleic acids derived from hepatitis C virus are able to anneal to the NS3 or NS4 gene of HCV, or a fragment. The nucleic acids may comprise at least 80 % identity to (S1) or at least 8 nucleic acids may comprise at least 80 % identity to (S1) or at least 8 nucleic acids may comprise at least 8 nucleic acids are useful for detecting from it. The nucleic acids or oligonucleotides derived from them can be used to diagnose HCV infections. The nucleic acids are useful for detecting HCV infection, including early stage detection, for . mutation in the HCV nucleic acid responsible for resistance or sensitivity to a therapy, or new mutations in the HCV genome correlated with resistance or sensitivity to a drug therapy, for determining whether iteratement with an agent should or should not be continued, for densitying the interaction between HCV and other viruses and/or diseases, for generating a nucleic acid which may be patient specific,

```
The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers pecifically priming and allowing amplification of each Wheta gene, becatand or conv. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, and neoplastic disease. Autoimmune diseases include Addison's disease, and neoplastic disease. Autoimmune diseases include Addison's disease, and neoplastic diseases. Autoimmune diseases include Addison's disease, and propried as a stroping and allamier's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Schistosomes, filaria and bacterial infections such as those caused by Schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases

The present invention describes a purified expressed delta tryptase polypeptide, its fragment or analogue. Also described: (1) a recombinant of bost cell expressing the polypeptide; (2) an antibody that selectively binds to the polypeptide; (3) identifying a compound that interacts, or binds with the polypeptide or its fragment or analogue; (4) screening for a compound that modulates the activity of the polypeptide, its fragment or analogue; (5) diagnosing a disease state, or predisposition to a disease state in a subject; (6) identifying an agent for treating or preventing a mast cell-mediated inflammation; (7) identifying an agent for treating or preventing a disease state in a subject; (8) treating or preventing a disease state in a subject; (9) inhibiting mast cell-mediated inflammatory disease state in a subject; (9) comprising at least one antibody, or polypeptide, its fragment or analogue as described above. The delta tryptase polypeptide has antibinflammatory, antiallergic, ophthalmological, antiallergic, ophthalmological, antiallergic, ophthalmological, antiallergic, ophthalmological, antialtarbritic and dermatological activities. Delta tryptase polypeptides are useful for treating asthma, allergic rhinitis, urticaria, angioedema,
                                                                                                                                      ö

Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.

Example 1; SEQ ID NO 71; 86pp; English.

The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preference in test organisms or parts, where the test organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an RESULT 351

Comparises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that encodes a regulatory polynucleotide operably linked to a tandem repeat encodes a reporter protein, which produces, or is predicted to produce a selected phenotype or a phenotype of the same class as the selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that canceds the polypoptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that canceds the polypoptide; and (7) a method of reducing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that canceds the polypoptide. The method is useful for constructing a spictorial phenotype to an organism of interest or part in a different a selected phenotype to an organism of interest or part in a different same polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism of the present sequence encodes the polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes a subthetic leader sequence, which is used in an example from the present organism or interest or part containing a synthetic construct that invention.

c selected phenotype to an organism of interest or part in a different candle that conferred by a parent polynuclectide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preference than the first codon in a comparison of phenotypic preference of a first codon in an organism of interest and organisms that are related to the organism of interest of interest and organisms that are related to the organism of interest of the synthetic polynuclectide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynuclectide constructed from the method above; (3) an organism or interest or part containing a synthetic construct that synthetic polynuclectide construct that organism or interest or part containing a synthetic construct that synthetic organism or interest or part containing a synthetic construct that condess a regulatory polynuclectide operably linked to a tandem repeat of a first codon flued in frame with a reporter polynuclectide that condess a reporter protein, which produces, or is predicted to produce a selected phenotype or a phenotype of the same class as the selected of phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynuclectide that and that results from the expression of a parent polynuclectide that can detect the properties; (6) a method of reducing the quality of a selected phenotype that is displayed by an organism of interest or synthetic polynoptide; and (7) a method of conder the polypeptide; and that results from the expression
                                                                                                                                                                                                                                                                                                                                                                                        Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 1; SEQ ID NO 39; 86pp; English.

l proliferative cell Predicting responsiveness of a subject with breast cell proliferati disorder, useful for treating or differentiating breast cell proliferative disorders comprises analyzing methylation pattern of genomic DNA from the subject.

Disclosure; SEQ ID NO 1628; 104pp; English.

The invention relates to a novel method for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acid by contacting at least one of the target nucleic acids in a biological sample obtained from the subject prior to or during treatment. The method of the invention has cytostatic activity, and may have a use in gene therapy. The set of oligonucleotides comprising at least two of the oligonucleotide comprising at least two of the oligonucleotide polymorphisms (SNPs) within the sequences. The methods, nucleic acid, oligonucleotide, and hit are useful for the treatment, characterisation, classification and/or differentiation, of breast cell proliferative disorders. The method is also useful for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy. The present sequence is used in the exemplification of the invention.

The invention relates to a novel method for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acid by contacting at least one of the target mucleic acids in biological sample obtained from the subject prior to or during treatment. The method of the invention has cytostatic acidity, and may have a use in gene therapy. The set of oligonucleotides comprising at least two of the oligomers are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) within the sequences. The methods, nucleic acid, oligonucleotide, and kit are useful for the treatment, characterisation, classification and/or differentiation, of breast cell proliferative disorders. The method is also useful for the creatment, characterisation, classification and/or differentiation, of breast cell proliferative disorders. The method is also useful for the disorder of the breast tissues to a therapy. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorder, useful for treating or differentiating breast cell

Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

Claim 2; Page 269; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves mRNA coding for a protein of respiratory syncytial virus (RSV) at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavege sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the target sequences and can be used for treatment and diagnosis of RSV infection. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-AUG-2003 to correct PI field.)

Antisense oligonucleotides 313-antisense-ON, 313-transition-AS-ON, 341-antisense-ON and 341-transition-AS-PN (see AAV32748-51) are based on the transition sites of human glutathione S-transferase (GST)-pi MGSTD1*C CMRNA (see AAV32718). MGSTD1*C CMRNA contains nucleotide transitions of A to G at 313 and C to T at 341. It was shown that translation of hGSTD1*C CMRNA is more effectively inhibited by AS-ONS containing the corresponding contain these transition nucleotides than consensus AS-ONS that do not contain these transitions. This indicates that expression of variant GST-pi genes can be down-regulated by targetting their transition regions with AS-ONS, allowing differential and specific down-regulation of the different GST-pi variants in cells. Certain variants of GST-pi are overexpressed in gliomas. Novel methods for the diagnosis, prevention and treatment of tumours are based on the differential involvement of variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Glutathione S-transferase, GST-pi gene, hGSTP1*C, human, tumour, cancer, leukaemia, lymphoma, melanoma, glioma, therapy; diagnosis, antisense, ss.

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
cend and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5512-74. These multiple target oligonucleotides
(specifically AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
diseases syndrome, pain, cystic fibrosis, pulmonary hypertension,
pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, pancreatic cancer,
hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
colon cancer, breast cancers which may metastasize or have metastasized
to the lungs, including breast and prostate cancer

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, and an inflammation. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic pulmonary disease (COPD), and cancers uch as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the content of the acese of deoxyadenosine which activates adenosine receptors causing bronchoost and inflammation. AAA12312 to AAA12312 to perseent the processor.
